

Climate Action and Human Generated Mangrove Systems in Fiji

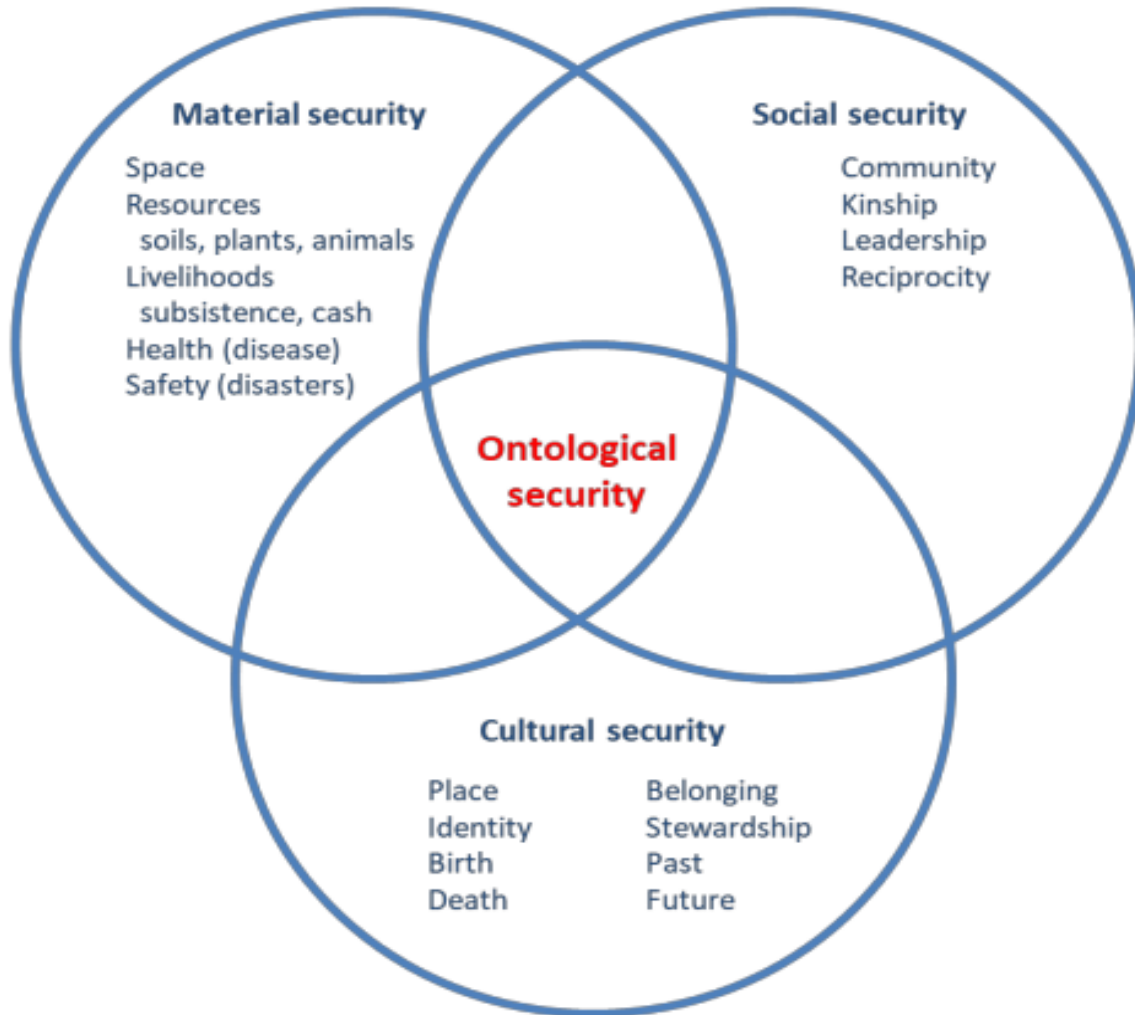

*Dr. Hilda Sakiti-Waqa, Lau Dr. Viliamu Iese, &
Professor Timothy Reeves.*

Figure 1: Assessing the Votua Natural Mangrove stand with children from Natutu village (one of the 3 villages surrounding the Votua Mangrove Natural stand).

Presented by: Salote. S. Nasalo
University of the South Pacific

Introduction

- The “*vanua concept*”, the changing climate, and initiating mangrove restoration programs in the hope to protect the “*vanua*” or “... in Cook Islands Maori, “*enua*” means “*land, country, territory, afterbirth*” (Pond, 1997: page 2).
- Mangrove restoration programs directly supports SDG’s.
- 90% of Fiji’s mangrove systems are situated at the two main islands situated of the 3 main deltas; Ba, Rewa and Labasa.
- 2019 Planting Initiative passed by the government “4 Million Tress in 4 years” and what transpired later on.

What is a “*Human Generated Mangrove System?*”

How it all began...

Issue: No proper M&E tool developed to monitor success rates, growth rates, etc.).

Study Gap: To study the regeneration of human generated mangrove systems in Suva, Fiji.

Importance: Development of a proper M&E for human generated mangrove systems.

Figure 3 (L-R): Featuring the planting sites for the PaCE-SD Graduate Students Association, eventually becoming the study sites of this research.

Objectives

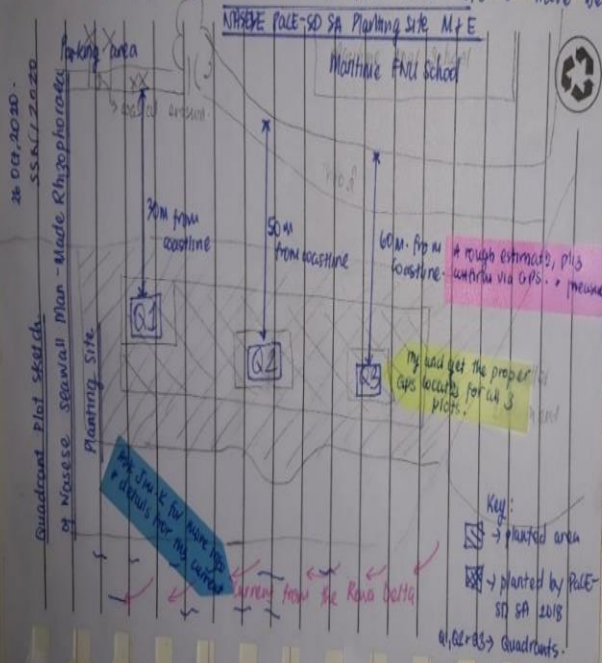

1. To monitor the regeneration process of human generated mangrove systems at the Nasese and the Lami foreshore (planting sites for the PaCE-SD Graduate Students Association).
2. To develop a proper M&E datasheet for a human generated mangrove system.
3. To provide recommendations from the experiences gained during the planting initiatives.

Figure 4: Crossing the Natutu village river to access the Votua Natural Mangrove Stand.

Development of an M&E Datasheet for Human Generated Mangrove Systems

General Comments: weather: cloudy and it rained heavily afterwards, I had to wait in the car b/c I did not bring my charger raincoat/umbrella. The planting hasn't been monitored since it was planted (2018), took Timou Kikyanu to show where they planted and assisted me with data taking. Noted that in the gaps, other people came and planted there as well. Sand texture very moist, richness of bivalves, organic waste and herb peddling for food around the quadrant of study. Time: 10:45 am, and it was completely low tide. Need to get proper field attire, and also first aid kit b/c I have been unfortunate in cutting myself during fieldwork.

26 Oct, 2020 / 56N 09g
 I will definitely need to have @ least two Research Assistants, and re-look @ my budget + improve on it. Ideas Need to have 3 plots for Lam area planting site 2 to compare + contrast the physical features and surrounding environment that have been the contributing factors to why their features are as such, collect the data on the newly designed M+E Datasheet done today

Results & Data Analysis

1 Year Old Human Generated Stands Average Height (cm)

1 Year Old Average Number of Leaves of Human Generated Stands

Tested Variables	Population Distribution Test			Population Variance Test			Variable Variation Test between samples		
	Test	p-value	Hypothesis Conclusion	Test	p-value	Hypothesis Conclusion	Test	p-value	Hypothesis Conclusion
Number of Leaves	Shapiro. Wilk	2.20E-16	Sample not normally distributed	Bartlett	0.0538	Sample variance is not significantly different	Kruskal-Wallis	0.02129	Significant difference in the # of leaves between samples
Plant height	Shapiro. Wilk	0.6725	Sample are normally distributed	Bartlett	0.9184	Sample variance is not significantly different	ANOVA	0.226	No significant difference in tree height between samples
Plant diameter	Shapiro. Wilk	2.20E-16	Sample not normally distributed	Bartlett	0.747	Sample variance is not significantly different	Kruskal-Wallis	0.02348	Significant difference in plant diameter between samples
Height of Barnacle	Shapiro. Wilk	0.3914	Sample are normally distributed	Bartlett	0.4328	Sample variance is not significantly different	Post Hoc	0.003686	Significant difference in barnacle height between NHG & LHG

Nasese Site:

- 6-7% survival rate after 2 years M&E
- Factors affecting survival rates:
 - * species of propagules
 - * location of planting
 - * community support and awareness
 - * popular planting site
- **Both the sites** – there is always a clean-up at the planting area of interest before the planting of propagules take place

Comparative Study:

Lami Site:

- 0% survival rate after 2 years of M&E
- Factors affecting survival rates:
 - * human induced factors (not supported by the surrounding communities)
 - * not so favorable condition (surrounded by informal settlements and industrialized area)
 - * exposed to high wave action
 - * highly polluted area

Mangrove Growth:

Recommendations

- * It is highly recommended to plant seedlings picked from nearby natural stand close to the desired planting site.
- * The need to have a proper M&E after a planting initiative to ensure high succession rate.
- * The need to consider the already existing ecosystems at the desired planting site. Take for instance, at the Nasese human generated planting site, replanting of mangroves had to be put to a halt because mangrove replanting was evading the mudflats and tidal shore where migratory birds normally rest before they continue with their migration.
- * Planting site needs to be probed and determined by experts because not all areas are suitable for mangrove planting or re-planting activities.
- * Have an awareness program for the surrounding communities at least several times before a planting initiative is carried out, as mentioned in this study/chapter, one of the major contributing factor to the unsuccessful rate of human mangroves regeneration process are humans. This is greatly evident in the Lami site.
- * Have the seedlings already planted in a nursery (preferably at the nearest natural stand of the site of planting interest) before a replanting activity for at least 6 months to increase compatibility and survival rate.
 - When planting, plant 2-3 seedling per plot to increase survival rate.
 - Mangrove Reforestation and Mangrove Afforestation.

Thank You for Listening 😊
